

# Numerical Simulation Methods in Geophysics, Part 9: 2D Helmholtz equation

## 1. MGPY+MGIN

*[thomas.guenther@geophysik.tu-freiberg.de](mailto:thomas.guenther@geophysik.tu-freiberg.de)*

# Recap

# The next lectures and exercises

- today (LV09): 08.01.25, no exercise on 09.01. (dies academicus)
- LV10: 15.01.25, exercise on 16.01.
- LV11: 22.01.25, exercise on 23.01.
- LV12: 29.01.25, exercise on 30.01.
- last VL13: 05.02.25, exercise on 06.02.
- report on 2D Helmholtz equations

# Recap

Done:

- finite difference method for Poisson (1D) and heat transfer
- wave equation modelling in 1D
- finite element method for Poisson equation
- weak form decreases order of derivatives
- Maxwell equations lead to Helmholtz equation

# Helmholtz equation for $\mathbf{E}$

Maxwell equation in frequency domain (see also [Theory EM](#))

$$\nabla \times \mathbf{H} = i\omega\epsilon\mathbf{E} + \mathbf{j} \quad (\sigma\mathbf{E} - \mathbf{j}_s)$$

$$\nabla \times \mathbf{E} = -i\omega\mu\mathbf{H} \Rightarrow \mathbf{H} = i\frac{1}{\mu\omega} \nabla \times \mathbf{E}$$

$$\nabla \times \mathbf{H} = i\omega^{-1} \nabla \times \mu^{-1} \nabla \times \mathbf{E} = (i\omega\epsilon + \sigma)\mathbf{E} - \mathbf{j}_s$$

Quasistatic approximation ( $\omega\epsilon \ll \sigma$ )

$$\nabla \times \mu^{-1} \nabla \times \mathbf{E} + i\sigma\mathbf{E} = i\omega\mathbf{j}_s$$

# Helmholtz equation for $\mathbf{H}$

Maxwell equation in frequency domain (see also [Theory EM](#))

$$\nabla \times \mathbf{E} = -i\omega\mu\mathbf{H}$$

$$\nabla \times \mathbf{H} = \sigma\mathbf{E} - \mathbf{j}_s \Rightarrow \mathbf{E} = \sigma^{-1}\nabla \times \mathbf{H} - \sigma^{-1}\nabla \times \mathbf{j}_s$$

$$\nabla \times \mathbf{E} = \nabla \times \sigma^{-1}\nabla \times \mathbf{H} - \nabla \times \sigma^{-1}\mathbf{j}_s = -i\omega\mu\mathbf{H}$$

Quasistatic approximation ( $\omega\epsilon \ll \sigma$ )

$$\nabla \times \sigma^{-1}\nabla \times \mathbf{H} + i\mu\mathbf{H} = \nabla \times \sigma^{-1}\mathbf{j}_s$$

# Helmholtz equations

$$\nabla \times \mu^{-1} \nabla \times \mathbf{E} + i\omega\sigma\mathbf{E} - \omega^2\epsilon\mathbf{E} = i\omega\mathbf{j}_s$$

$$\nabla \times \sigma^{-1} \nabla \times \mathbf{H} + i\omega\mu\mathbf{H} - \omega^2\epsilon\mu/\sigma\mathbf{H} = \nabla \times \sigma^{-1}\mathbf{j}_s$$

PDEs identical  $\mathbf{E}$  and  $\mathbf{H}$  through exchanging  $\mu$  and  $\sigma$

component perpendicular to modelling frame (E/H polarization)

$$\nabla \times a \nabla \times = -\nabla \cdot a \nabla$$

# Finite element discretization

- weak formulation (for E)

$$\int_{\Omega} \mu^{-1} \nabla v_i \cdot \nabla v_j d\Omega + \omega \int_{\Omega} \sigma v_i v_j d\Omega = \int_{\Omega} v_i f d\Omega$$

- stiffness = second derivative  $\nabla \cdot \mathbf{v}_i$ , expressed by 2 gradients

$$\mathbf{A}_{i,j} = \int_{\Omega} \nabla v_i \cdot \nabla v_j d\Omega$$

# Finite element discretization

- weak formulation (for E)

$$\int_{\Omega} \mu^{-1} \nabla v_i \cdot \nabla v_j d\Omega + \omega \int_{\Omega} \sigma v_i v_j d\Omega = \int_{\Omega} v_i f d\Omega$$

- mass matrix resembles functions  $\mathbf{v}_i$

$$\mathbf{M}_{i,j} = \int_{\Omega} v_i \cdot v_j d\Omega$$

# Next steps

- solve 1D Helmholtz equation complex-values
  - compare with analytic solution
- solve 2D Helmholtz equation
  - use secondary field approach
- use wide range of frequencies
  - combine E and H to yield MT sounding curves
- excursion on 3D vectorial Maxwell solvers
- overview on equation solvers and high-performance computing
- outlook to computational fluid dynamics

# Complex or real-valued?

The complex valued system

$$\mathbf{A} + j\omega\mathbf{M} = \mathbf{u} = \mathbf{b}$$

could be discretized by complex-valued shape functions

OR be transferred into a doubled real-valued system

$$\begin{pmatrix} \mathbf{A} & -\omega\mathbf{M} \\ \omega\mathbf{M} & \mathbf{A} \end{pmatrix} \begin{pmatrix} \mathbf{u}_r \\ \mathbf{u}_i \end{pmatrix} = \begin{pmatrix} \mathbf{b}_r \\ \mathbf{b}_i \end{pmatrix}$$

# Secondary field approach

Consider the field to consist of a primary (background) and an secondary (anomalous) field  $F = F_0 + F_a$

solution for  $F_0$  known, e.g. analytically or 1D (semi-analytically)

$\Rightarrow$  form equations for  $F_a$ , because

- $F_a$  is weaker or smoother (e.g.  $F_0 \propto 1/r$  at sources)
- boundary conditions easier to set (e.g. homogeneous Dirichlet)

# Secondary field Helmholtz equation

The equation  $-\nabla^2 F - k^2 F = 0$  is solved by the primary field for  $k_0$ :

$-\nabla^2 F_0 - k_0^2 F_0 = 0$  and the total field for  $k_0 + \delta k$ :

$$-\nabla^2 (F_0 + F_a) - (k_0^2 + \delta k^2)(F_0 + F_a) = 0$$

$$-\nabla^2 F_a - k^2 F_a = \delta k^2 F_0$$

## Note

Same operator, source terms at anomalies, weighted by the primary field.

# Secondary field for EM

Maxwells equations  $k^2 = -i\omega\mu\sigma$

$$-\nabla^2 \mathbf{E}_0 + i\omega\mu\sigma \mathbf{E}_0 = 0$$

leads to

$$-\nabla^2 \mathbf{E}_a + i\omega\mu\sigma \mathbf{E}_a = -i\omega\mu\delta\sigma \mathbf{E}_0$$

## Note

Source terms only arise at anomalous conductivities and increase with primary field

# Secondary field for EM

$$-\nabla^2 \mathbf{E}_a + i\omega\mu\sigma \mathbf{E}_a = -i\omega\mu\delta\sigma \mathbf{E}_0$$

leads to the discretized form (**A**-stiffness, **M**-mass)

$$\mathbf{A}\mathbf{E}_a + i\omega\mathbf{M}_\sigma \mathbf{E}_a = -i\omega\mathbf{M}_{\delta\sigma} \mathbf{E}_0$$

```
1 A = stiffnessMatrix1DFE(x=z)
2 M = massMatrix1DFE(x=z, a=w*mu*sigma)
3 dM = massMatrix1DFE(x=z, a=w*mu*(sigma-sigma0))
4 u = uAna + solve(A+M*w*1j, dM@uAna * w*1j)
```

# 2D problems

Make use of pyGIMLi

See documentation on [pyGIMLi.org](https://pyGIMLi.org)

# The meshtools module

```
1 import pygimli as pg
